

Ednar's Cauldron — Tuning Cheat Sheet

Haptics + HP-number crossfade · plain-language knob reference · June 26, 2026

How to use this

Every value below is a single number you can change. Bigger **intensity** = stronger buzz. The **character** of a buzz (soft vs. sharp) comes from which generator it uses — that's noted where it matters. Find the knob name in the file listed for each section, change the number after the =, and rebuild.

1 · HAPTICS (the buzzes)

File: `Shared/HapticManager.swift` → section “Ednar’s Potion Cauldron.” There are three separate moments, each with its own knobs. They do not overlap.

ROLL — dice tumbling into the tray (when a hand is dealt)

A rattle that stays strong, lasts the whole spin, and slows down to one firm landing tap. Rattle taps use the **medium** generator; the final tap uses **heavy**.

Knob	Now	What it does
<code>cauldronRollTapCount</code>	9	How many rattle taps during the tumble. More = busier rattle.
<code>cauldronRollDuration</code>	1.1	Total length in seconds. Make it match how long the dice visibly spin. Ends too early or late? Nudge this.
<code>cauldronRollDeceleration</code>	2.3	How dramatically it slows down. Higher = taps bunch at the start and spread out, ending on one clear tap. Lower (~1.5) = a more even rattle.
<code>cauldronRollStartIntensity</code>	0.9	Strength of the rattle taps (0–1). Want it punchier? Raise toward 1.0.
<code>cauldronRollSettleIntensity</code>	1.0	Strength of the single landing tap at the very end.

PLACE — a die dropping into a node

One short, sharp tap. It uses the **rigid** generator on purpose, so it feels different from the soft roll rattle (they used to blur together).

Knob	Now	What it does
<code>cauldronPlaceIntensity</code>	0.7	Strength of the placement tap (0–1). This is the only knob for placement feel.

HIT — a combat hit during the brew

A heavy thud — used when your brew lands on a customer, and when customers strike Ednar.

Knob	Now	What it does
<code>cauldronHitIntensity</code>	0.9	Strength of a combat hit (0–1).

Mute everything: set `PotionShopHaptics.enabled = false` in `PotionShopGameState.swift`.

Won't buzz? Haptics fire only on a real iPhone (not the Simulator or iPad), and need Settings → Sounds & Haptics → System Haptics turned ON.

Want a different character (not just strength)? Change which generator the method calls — soft → sharp order is: light < medium < heavy < rigid.

2 · HP-NUMBER CROSSFADE (the previewing number)

File: PotionShopCustomerSceneView.swift → struct PotionShopRollingHPText (near the top, around line 2006).

What it does

Once the active customer's HP number settles on the **affected** value (their HP after the damage your placed dice *would* deal), it gently alternates between that affected number and their **current** HP — so the player sees both “what it is” and “what it'll become.” It stops on brew, when the customer goes inactive, or when the board changes.

Knob	Now	What it does
crossfadeHold	0.9	Seconds each number stays on screen before fading to the other. Bigger = slower, calmer back-and-forth.
crossfadeFade	0.35	Seconds the fade itself takes. Bigger = softer, dreamier blend; smaller = snappier swap.

Rule of thumb: crossfadeHold sets the rhythm (how often it flips), crossfadeFade sets the smoothness (how gentle each flip is).

Full written detail lives in CAULDRON_CONTEXT.md §53 (haptics, crossfade, and the brew “–X” damage number). This sheet is the quick reference — keep it next to you while tuning.
